                                                                                                                                                     The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.

The sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polynucleotide or complement, and detecting the presence of the target PS108 polynucleotide. The method comprises contacting the presence of the target ps108-specific polynucleotide. The products can be used for detecting,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, prostatic intraepithelial neoplasia (PIN) and cancer. In particular the products can be used in drug screening and gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate cancer. They can also be used to produce antibodies which can be used in treatment. The present sequence is one of the PS108 partial protein sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        40

The sequence represents the amino acid sequence of prostate-specific PS108 #1, encoded by PS108 expressed sequence tag (EST) consensus sequence. The sequence was produced from overlapping PS108 ESTs sequences to produce a full length consensus sequence. This sequence was then used to produce the PS108 polypeptide which is useful in assays for detecting antibodies to prostate tissue, and as an immunogen to produce antibodies. The polypeptide is useful for screening compounds which specifically bind to the polypeptide and for screening for drugs, compounds, or any other agent which can be used to treat diseases associated with PS108. The antibody is useful to detect, or for image localisation of, PS108 antigen

delivery agents for therapeutic agents as well as for diagnostic tests and for screening for diseases or conditions associated with PS108, especially cancer. The antibody is also useful for generating chimeric antibodies for therapeutic use, for inhibiting the biological activity PS108, in therapy (for e.g. to treat prostate tissue disease including prostate cancer and its metastases), and to detect the presence of any polypeptide in a test sample which shares one or more antigenic determinants with the PS108 polypeptide.

(HUMA-) HUMAN GENOME SCI INC

Baker Fiscella M, Wei P, Komatsoulis GA, Ruben SM,

2001-308779/32

New nucleic acid encoding one of 21 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions, such as autolmmune disease and cancer, and used as a food additive or preservative -

Disclosure; Page 476-477; 490pp; English.

AAD05220-AAD05282 represent cDNAs corresponding to 21 human secreted protein genes, and AAE01352-AAE01413 represent the proteins they encode. AAE01415-AAE0143 represent thuman secreted proteins they encode. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new genes. Specific uses are described for each of the 21 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoletic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cognitive disorders, schizophrenia, asthma, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, tadney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., and organization can be used immunosospay (ELISA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               libraries. The patterns of both gene sets are compared to identify genes of unknown function with similar expression patterns to the prostate cancer-specific genes. The biomolecules identified by the method form pharmaceutical compositions useful for the diagnosis and treatment of diseases associated with cell proliferation. Such diseases include cancer of the adrenal gland, bladder and bone, but especially prostate cancer. The method may also be applied using other diseases specific genes. The prostate cancer-specific genes facilitate the diagnosis and treatment of cell proliferation disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "potential casein kinase II phosphorylation site"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is encoded by a prostate cancer-associated gene, whose cDNA is represented by Incyte clone number 1864683. The cDNA sequence is used in the method of the invention. The specification describes a method for identifying biomolecules for the diagnosis or treatment of diseases associated with cell proliferation. The method comprises examining polynuclectides, consisting of prostate cancer-specific genes, and genes of unknown function, expressed in cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying biomolecules for the diagnosis and treatment of diseases associated with cell-proliferation {}^{-}

The prostate cancer associated gene composed cancer associated gene. The prostate cancer associated gene composed to the invention. The specification describes a method for identifying biomolecules for the diagnosis or treatment of diseases associated with cell proliferation. The method comprises examining polynucleotides, consisting of prostate cancer-specific genes, and genes of unknown function, expressed in cDNA libraries. The patterns of both gene sets are compared to identify genes of unknown function with similar expression patterns to the prostate cancer-specific genes. The biomolecules identified by the method form pharmaccutical compositions useful for the diagnosis and treatment of diseases sociated with cell proliferation. Such diseases include cancer of the adrenal gland, bladder and bone, but especially prostate cancer. The method may also be applied using other disease-specific genes. The prostate cancer-specific genes are prostated cancer-specific genes facilitate the diagnosis and treatment of cell proliferation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                447 AIGGICAIGAACIICTCCICIACCCCCACIICCAGCAGCAGAGGCGGCACAIAGGIGAIG 388

AMD05220-AAD05282 represent cDNAs corresponding to 21 human secreted protein genes, and AAE01352-AAE01413 represent the proteins they encode. AAE01413 represent human secreted protein fragments or variants. CC The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. The secreted proteins and their genes are useful for preventing, treating corresponding to on the tissues in which they are most highly expressed, and include the new genes. Specific uses are described for each of the 21 genes. The new genes. Specific uses are described for each of the 21 genes. The new genes. Specific uses are described for each of the 21 genes. The new genes. Specific uses are described for each of the 21 genes. The composition of the diagnosis or treatment of proliferative disorders, diseases of the immune system, AIDS, autoimmune disorders, cancer, theumatoid arthritis), inflammation, allergies, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, conditive disorders (e.g., Alzheimer's disease, Parkinson's disease), conditive disorders, alabetes, atherosclerosis, cardiovascular disorders, pregnancy-related disorders, and disorders, and independent tissues, the dentify disorders, asthmic and also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding carters, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a content the invention can be used in allevatating symptoms associated with the disorders mentioned above, and in diagnostic immunoassay erg, the present sequence represents a human secreted protein of the invention of the invention of the human secreted protein of the invention of the invention of the invention of the invention of the inventi

ABG63326-ABG65518 represent albumin fusion proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and disgnosing disorders such as cancer, reproductive disorders, disease, also crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzhaimer's, Parkinson's, Creutzfeldt-Jacob disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to albumin fusion proteins comprising

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cellcell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed the specification, but was obtained in electronic format directly from urbo

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The sequence data for this patent did not form part of the printed specification.

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antaqonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and the proteins are useful in genetic vaccination, testing and the proteins are useful in agentic vaccination, testing and the concress stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids encoding a range of human polypeptides, useful in genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; vaccination; gene therapy; nutritional supplement; stem cell proliferation; haematopoiesis; nerve tissue regeneration; immune suppression; immune stimulation; anti-inflammatory; leukaemia.

polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and isolated
T calls prepared using (I) or (II) are used treat cancer in a patient.
(I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) and (II) can be used for monitoring the progression of cancer in a patient.
(I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to exemplification of the present invention.

                                                          Pendent group; repeating unit; enzyme recognition site; sealant; fibrin; enzymatic cross-linking; blocompatible material; structural integrity; medical adhesive; wound closure; tissue repair; transglutaminase.
         The amino acid sequence of the protein polymeric adhesion substrate (PPAS) 1-B. The protein comprises 10 repeats of the PPASI-B monomeric repeat (AAR80326) which consists of the CLP 3.7 gene encoded sequence (AAR80321) linked to the human fibrin cross-linking substrate peptide 93.2 sequence (AAR80316). The polymers can be used in biological systems where in situ formation of a biocompatible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             76 GlySerProGly------AlaProGlyThrProGlyGluGlyGlnGlnHis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.

Protein polymer adhesive substrate PPASI-B comprises 10 repeats of a monomer (see AAW49714) consisting of human fibrin gamma chain peptide 93.2 (see AAW49708) inserted into a structural backbone of collagen repeat motifs (see AAW49711). The 68 kDa PPASI-B FOLYMER has been expressed in Escherichia coll HBIO1 transformants using plasmid pPT0324. Claimed recombinant protein polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good adhesive properties and high strength. CLP (collagen like protein) polymers are extremely soluble in water, allowing protein solutions of over 10 wt.% to be formed while maintaining good flow properties. CLP polymers have good adhesion to hydrophilic surfaces and therefore may adhere well to tissue. The fibrin peptide 93.2 inserts of PPASI-B provide glutamine donor sites for Factor XIIIa mediated cross-linking.

```
This sequence represents a unnatural collagen-like polymer of the invention. The products may be used as films, fibres, moulded objects and admixed with other natural or synthetic polymers or coatings on fibres, films, labware or other surfaces, e.g. prosthetic devices. The polymers may be used for binding a wide variety of specific binding materials, as catalytic substances (where the amino acid sequence may specifically chelate a wide variety of elements), as purification media, composites, laminates or adhesives. They may also be combined with inorganic or organic materials such as carbon fibres, nylon fibres, nitrocellulose, etc., as flask coatings or in synthetic matrices for the growth and study of cells, as affinity columns or as supports for blological materials. The polymers have collagen-like properties, but may sequences can be tailored to give the desired properties.
             Recombinant collagen-like polymers - useful for making gels, films, fibres, etc.
                                                                                                Example 7; Column 51; 93pp; English

RESULT 1
```

of a prostate tumour protein. The encoded immunogen, or the DNA itself, can be used as a vaccine for the treatment of prostate cancer. The DNA was identified by analysis of a subtracted cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library. cancer prostate οţ Claim 3; Page 79-80; 130pp; English the ņ nseq

Sequence 3410 BP; 667 A; 1014 C; 945 G; 783 T; 1 other;

polynocleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding the antigen-presenting cells are useful for stimulating and/or expanding of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune assponse, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific
                           human prostate-specific polypeptides and polynucleotides useful for diagnosis and treatment of cancer, especially prostate cancer , ,

(II) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GTGATGAGACGTGCCCCACTGAGGTGCCCCACAGCAGCAGGTGTTGAGCATGGGCTGAG

```

The present invention describes an isolated polypeptide (P1) comprising to least an immunogentc portion of a prostate-specific protein, or its variant. Also described are polynucleotides (N1) encoding (P1). (P1) and (N1) have cytostatic activity and can be used in vaccine production. The polypeptides, nucleic acids and antibodies from the present invention are useful in the diagnosis and therapy of prostate cancer. Prostate specific genes P704P, P712P, P77FP and B305D are located in a genomic region on chromosome 22q11.2 known as the Cat Eye Syndrome region. Prostate specific antigen (PSA) P501S was located on chromosome 1. AAH84671 to AAH85143 and AAG99000 to AAG99077 represent

                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated polypeptide (I) comprising at least an immunogenic portion of a prostate tumour antigen protein or lits variant. (I) have eytostatic activity and can be used in vaccine production. (I), prostate tumour antigen polynucleotides, an antigen presenting cell (APC e.g. a dendritic cell) that expresses (I), and a pharmaceutical composition containing (I) are useful for inhibiting the development of cancer in a patient. Antibodies specific for prostate specific proteins and oligonocleotides that hybridise to a polynucleotide that encodes a prostate specific protein are useful.

```
The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a CDNA described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GTGATGAGACGTGTCCCCCACTGAGGTGCCCCACAGCAGCAGGTGTTGAGCATGGGCTGAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to polynucleotides encoding breast tumour polypeptides. The sequences are useful for treating cancer, preferably becast cancer, in a patient or for stimulating an immune response. The polynucleotides and polypeptides are also useful in the diagnosis and monitoring of breast cancer. A method for detecting the presence of a cancer in a patient, comprises obtaining a biological sample from the patient, contacting the biological sample with a binding agent that bind to a breast tumour polypeptide, detecting in the sample an amount of polypeptide to a predetermined cut-off value, therefore determining the presence of a cancer in the patient. Sequences ABK28920-ABK29025 represent cDNA clones encoding human breast tumour polypeptides of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes isolated polypeptides, comprising an immunogenic portion of a prostate tumour protein (PTP). The polypeptides and polynucleotides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polynucleotides encoding them, antigen presenting cells which express comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polynucleotides encoding the polypeptides can be used a a probe or the modulate the expression of the polypeptides. AAA06241 to AAA06691 and AAX82000 to AAX82000 represent sequences used in the exemplification of

The invention relates to an isolated PROST 03 polypeptide (I) and to the polynucleotide (II) encoding PROST 03. Fragments of (I) were used to generate antibodies (III) to PROST 03. (III) 1s useful for selectively destroying a cell expression of PROST 03. (III) 1s useful for selectively east-octated with expression of PROST 03 in a human patient. (III) is useful for diagnosing and treating diseases of cell proliferation such as prostate cancers. (I) is also useful for diagnosing and treating diseases of cell proliferation such as prostate cancers. (I) is also useful for generating antibodies to PROST 03. (III) is useful in detecting the levels of PROST, (3) polypeptides in cells and tissues, and in targeting drugs to primary and metastatic tumours. (I) is also useful for stimulating immune response to PROST 03 containing cells. (II) is useful in diagnostic assays for detecting the levels of polynuclectides encoding PROST 03 in cells and tissues. (II) is useful as DNA probes, as targets for antisense and ribozyme therapy, and as templates for the production of antisense polynuclectides. (I) and (II) are useful in research, biological,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             122

The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, polypeptides for antigenic epitopes antibodies raised against the polypeptides for antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynocheotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The present sequence is a prostate specific detecting cancer. The present sequence is a prostate specific

l è	, ,	S	Claim 1; Page 460-461; 543pp; En
\$		00 -	The present invention describes

polynucleotide sequences (I) which encode

prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and isolated artibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to exemplification of the present invention.

Sequence 4034 BP; 721 A; 1226 C; 1141 G; 946 T; 0 other;

                     The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a CDNA described in the invention.
                                                                                                                                                           63

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        87
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to methods of detecting a prostate cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer associated genes are useful for diagnosing or treating prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in gene therapy, as a vaccine or in antisense applications.

The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer

19-JUL-2001. 16-JAN-2001; 2001WO-US01574. 14-JAN-2000; 2000US-0483672. (CORI-) CORIXA CORP. Xu J, Dillon DC, Mitcham JL, Harlocker SL, Jiang Y, Reed SG; Wanger GR, Day CH, Retter MW, Stolk JA, Skeiky YAW; Wang A, Meagher MJ; WPI; 2001-425873/45. New polynucleotide encoding a prostate-specific protein, for diagnosing, monitoring and treating prostate cancer in a patient and for use in vaccines - Claim 1; Page 459-460; 543pp; English. The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), and can patient. The cells prepared using (I) or (II) are used treat cancer in a patient. To cells prepared using (I) or (II) are used treat cancer in a patient. The cancer that is diagnosed or treated is particularly patient. The cancer that is diagnosed or treated is particularly prostate cancer (I) and (II) can be used for monitoring the progression of cancer in a patient. The bused for monitoring the progression of cancer in a patient. (I) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to exemplification of the present invention.

The invention relates to isolated prostate-specific polypeptides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of encer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding reals specific for a tumour protein, and for inhibiting the development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The present sequence is a prostate specific polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human prostate-specific polypeptides and polynucleotides useful diagnosis and treatment of cancer, especially prostate cancer -

Db 4551 AAATTTCCCCTACCCCCAACTTCCCCCAACTTCCCCACCA	RESULT 21 AAH93866 ID AAH93866 standard; cDNA; 4894 BP. XX AC	XX	XX XX XX XX XX XX XX XX Cand can be used invention describes polynucleotide sequences (I) which encode CC prostate-specific proteins (II). (I) and (II) have cytostatic activity, CC and can be used in vaccine production and gene therapy. (I), (II), CC antibodies to (II), fusion proteins comprising (II), and isolated CC T cells prepared using (I) or (II) are used treat cancer in a patient. CC (I) and the antibodies are also used in the detection of cancer in a CC patient. The cancer that is diagnosed or treated is particularly CC (I) and (II) can be used in vaccines. The antibodies or CC (I) and (II) can be used for monitoring the progression of cancer in a patient. CC (I) and (II) can also be used to improve diagnostic and therapeutic CC (I) and (II) can also be used to improve diagnostic and therapeutic CC as well as the prostate cancer. They can indicate the level of metastasis CC AAM01318 represent polynucleotide and amino acid sequences used in the

                                                                                                                                                                                                                                                                                                                                                                                The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a cDNA described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 515 TGGCGTGGACGCTATGGCCGCCGCCGTTCATCTGGGCACTGTCCTTGGGCATCCTG

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM, Komatsoulis GA, Wei P, Fiscella M, Baker KP;

WPI; 2001-308779/32. P-PSDB; AAE01362 New nucleic acid encoding one of 21 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions, such as autoimmune disease and cancer, and used as a food additive or preservative

Claim 1; Page 388-389; 490pp; English.

AAD05220-AAD05282 represent cDNAs corresponding to 21 human secreted ARD1415-AAB01431 represent human secreted protein fragments or variants. The secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 21 genes, developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetenl and developmental abnormalities, hemantopoletic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, autoimmunt neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, echizophrenia, stind disorders (e.g., and storders, and infections represented alsorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proteins to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or

4
preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or.enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding cDNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           995 TCGCCCCACTGCTGTCCATGCCGGGCCCGCTTGGCTTTCCGGAACCTGGGCGCCCTGCTT 1054

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           540
                                                                                                                                                                       The present sequence represents the consensus sequence for a PS108 gene. The sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method presence of a target PS108 polynucleotide in a test sample. The method polynucleotide or complement, and detecting the presence of the target PS108 polynucleotide. The products can be used for detecting, polynucleotide. The products can be used for detecting, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, prostatic intraeplithelial neoplasia (PIN) and cancer. In particular the products can be used in drug screening and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

contacting the test sample with at least 1 PS108-specific polynucleo or complement, and detecting the presence of the target PS108 polynucleotide. The products can be used for detecting, diagnosting, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis prostatic intraepithelial neoplasia (PIN) and cancer. In particular products can be used in drug screening and gene therapy.	Sequence 2145 Br; 410 A; 021 C; 303 G; 341 T; U OLDEF;	Query macun Best Local Similarity 99.8%; Pred. The present sequence is derived from a prostate cancer-associated gene, and is represented by Incyte clone number 186463. The sequence is used in the method of the invention. The specification describes a method for identifying biomolecules for the diagnosis or treatment of diseases associated with cell proliferation. The method comprises examining polymolecules, consisting of prostate cancerspecific genes, and genes of unknown function, expressed in cDNA libraries. The patterns of both gene sets are compared to identify genes of unknown function with similar expression patterns to the prostate cancer-specific genes. The biomolecules identified by the method form pharmaceutical compositions useful for the diagnosis and treatment of diseases associated with cell proliferation. Such diseases include cancer of the adrenal gland, bladder and bone, but especially prostate cancer. The method may also be applied using other diseasers specific genes. The prostate cancer-specific genes facilitate the diagnosis and treatment of cell proliferation disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate cancer. They can also be used to produce antibodies which can be used in treatment. The present sequence is one of the PS108 partial coding sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 GGGCCTGTACCAGGCGTGCCCAGAGCTGAGCCGGGCACCGAGGCCCGAGACACTATGA 60
